Where strategy meets connectivity

FULL-STACK AI SERIES · DIAGRAMS

The Plumbing, The Examples, The Paths, The Loop Back, The Human

An illustrative pattern, not a universal claim: how data moves through operations today, two concrete examples before and after full-stack AI, and how the loop back compounds.

The full plumbing, current state

Arrows rarely point back up in this pattern. Data ownership stays with the client throughout; typically only access is restricted at the boundary.

Trade reconciliation

Same six stages, re-architected: steps 2-5 move from isolated, manual judgment to a shared record with a governed decision, before reaching a person.

Proxy reconciliation

Same six stages, re-architected: the notice is understood, not just read, before a challenge is raised, closer to when it appears, not after the fact.

The two paths, side by side

The loop back, simplified

The resolution loops back to Source: the same governed pattern is available the next time this case type appears, anywhere in the chain.

What remains human

Routine, precedent-backed cases

AUTOMATED

Resolved end to end by the system, within governed, pre-approved boundaries.

Ambiguous but bounded cases

AGENT DRAFTS, HUMAN APPROVES

The system prepares a recommendation and the evidence behind it; a person decides.

Novel, material, or policy-sensitive cases

HUMAN DECISION + CONTROLLED RULE CHANGE

A person resolves the case directly, and any resulting rule change goes through governed change control.

All three feed the same governed learning loop, so the boundary between them shifts only as evidence earns it.
